

If you are getting the manual concreting done, keep these points in mind:

01

Mix the cement and sand till it gets uniform colour.

02

After that, put the mixture on the aggregates and mix it properly with the help of a shovel.

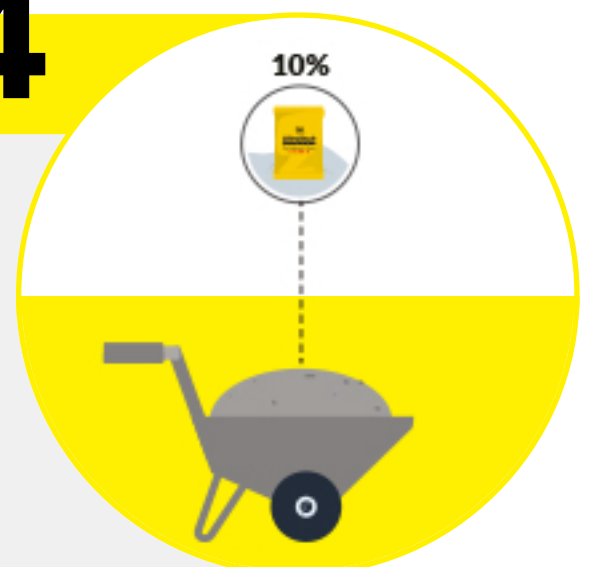

03

Make a ditch at the centre of the mixture and pour water in it and mix it from outside to inside, till you get the concrete with the desired consistency.

04

While mixing the concrete manually, 10% more cement is required. Note that, it is necessary to use the mixture at the earliest, else the concrete may get set.
